PMC Secures ISO/IEC 27001:2013 Accreditation

Leading Technology Services Provider, PMC, has secured accreditation to ISO/IEC 27001, the international Information Security Standard for the effective management of information assets.

Achieving the accreditation within the exceptional time period of six months, half the time a business of our size normally takes to achieve certification, reflects the impressive quality of PMC security processes already in place across the business, and the PMC project management expertise in complex programme management.

The accreditation extends across all business areas, including Managed Services, Development, Testing, Project Management and Consulting Services, and has been achieved across both our UK and India operations, demonstrating PMC's 'one company' philosophy and unified processes and culture.

For PMC customers this means that information in all its forms, whether digital, paper-based or stored in the cloud is secure, protected by data security procedures with embedded security controls aligned to the requirements of the ISO/IEC 27001 standard.

The accreditation follows an extensive and rigorous review of existing security processes and controls to enhance them and adopt additional world class tools to further strengthen them. As the risks associated with [cyber attacks and data breaches](#) continue to increase, information security has become a critical issue for every business.

Speaking about the successful accreditation to ISO/IEC 27001, PMC [Managed Services Director](#), Phil Bailey explains, *"This was an important milestone in PMC's growth and one of the investments we are making as a business. Compliance to an International standard demonstrates to our customers and prospective customers alike that we place great importance and focus on our security in everything that we do, across our entire business"*

About ISO27001 Accreditation

ISO/IEC 27001 is the international standard that provides the specification for information security management systems (ISMS). ISO27001 provides specifications, codes of conduct and best practice guidelines to ensure strong information security management. Accreditation to ISO/IEC 27001 also enables organisations to comply with GDPR and the NIS (network and information systems) regulations.

The emphasis is on the confidentiality, integrity and availability of data and systems. ISO/IEC 27001 is the mainstay of the ISO/IEC27000 Series, a family of mutually supporting information security standards that provide a globally recognised framework for best practise information security management .

About PMC (Paul Mason Consulting)
